

Central Role of the Leaving Group in Complex Systems Chemistry

Henri-Philippe Mattelaer¹ and Piet Herdewijn^{1*}

ABSTRACT Leaving groups (LGs) play a key role in complex reaction networks; not only do they provide the chemical energy to drive reactions, but they additionally provide benefits that steer reaction networks. This phenomenon is not limited to artificial systems, and it is the goal of this review to emphasize both similarities and differences between recent scientific discoveries and the current natural order.

Keywords: Leaving group, prebiotic chemistry, activating agents, peptides, nucleotides
